While all contributing factors are not fully understood, people in industrialized societies, particularly in the United States, are developing more allergies, at a younger age, that are more severe than ever before. Homeopathic medicine has demonstrated remarkable potential to lessen a person’s susceptibility to developing allergies, and to lower the severity and frequency of these conditions. Conventional allergy medications, used in a growing number of long-term daily users and children, pose significant health risks. Antihistamine use is associated with increased risk of developing dementia, decongestants increase blood pressure, corticosteroids (in metered dose inhalers) weaken vocal chords, and orally administered corticosteroids are associated with increased risk of developing diabetes, osteoporosis, cataracts and growth disturbances. Leukotriene modifiers are associated with increased risk of developing different psychological disturbances.

None of these side effects have ever been associated with homeopathic treatment, since homeopathy does not cause harmful side effects. On the contrary, homeopathy has been found to increase overall health, in a holistic manner, without inducing long term complications or adverse drug reactions. Homeopathy is usually more cost effective over a person’s lifetime, including those with allergies.

Conventional allergen immunotherapy or desensitization is a relatively new approach to allergy treatment and shares some commonality with the homeopathic principle of using a small amount of a substance capable of causing symptoms to treat those same symptoms. In homeopathy, this principle is known as the Law of Similars (or “like cures like.”) However, there is a difference between homeopathy and conventional desensitization: homeopathic medicines are prepared differently. Not only are they more highly diluted, but they are also mechanically agitated (succussed) following precise guidelines established more than two centuries ago.

Ongoing research indicates that nanostructures, including nanoparticles from the original source material are generated by these mechanical stress forces and that they persist in all homeopathic medicinal dilutions. Data analysis suggests that these nanoparticles are biologically active via an adaptive network nanomedicine form of hormesis. It appears that these ultra-high dilution levels of homeopathic medicines eliminate the risk of developing anaphylaxis (potentially fatal collapse) and a myriad of other common side effects seen in conventional allergy immunotherapy treatment.
Both clinical and laboratory research demonstrate that homeopathic preparations (resulting from the combined techniques of dilution and succussion— as opposed to simple dilution alone) yield biologically active medicines capable of producing significant impact in the treatment of allergies.9

Scientific Evidence

The classical homeopathic methodology demands that the selection of medicines be based on the totality of symptoms expressed by the individual patient, rather than on the particular allergen itself (which is the method used in modern desensitization treatment methods.) The latter method, known as “isopathy” (in Greek, homeo means “similar” and iso means “same”) shares some common ground with, but is significantly different from the homeopathic approach.

Different people exposed to the same allergen react differently and express a wide range of allergic symptoms. The homeopathic process matches (individualizes) medicines to each individual. This selection process makes the scientific study of homeopathy more challenging, when compared to the conventional medical research process of pre-selecting the same substance that will be administered randomly to a large groups of people with matched placebo controls. To simplify the study process, many homeopathic studies have utilized isopathic mixtures of common allergens as interventions, rather than going through the process unique to homeopathy, which includes individualization.

One of the most important studies conducted on the homeopathic treatment of allergies was a double-blind placebo-controlled trial using a combination of flower pollens in the treatment of hay fever. After treatment, the placebo group had six times more symptoms than the homeopathic treatment group. The homeopathic treatment group in this study needed half as many antihistamines due to the reduction of their allergy symptoms.10

Another double-blind placebo controlled study evaluated the use of homeopathic medicines prepared specifically from an isopathic formulation of the substance that individuals were most allergic to. Those receiving the homeopathic preparation demonstrated superior breathing (demonstrated by nasal inspiratory peak flow) compared with placebo. Improvements were equivalent to measurements that were typically observed in those using oral steroids. Homeopathic subjects demonstrated improvement that was 7 times better than the placebo group.11

A month-long randomized placebo controlled double-blind clinical trial utilized homeopathic preparations of common allergens during allergy season in the Southwest U.S. The study demonstrated significant improvement in the homeopathic group compared to placebo (p < 0.05). There were no reported adverse events, indicating the potential benefits of homeopathic intervention in reducing symptoms and improving quality of life in patients with seasonal allergic rhinitis.12

A systematic review of randomized controlled trials of allergic rhinitis through 2015 found that homeopathic medicines reduce both ocular and nasal allergy symptoms.\textsuperscript{13}

**In Vitro Use of Homeopathy**

High quality, controlled trials of homeopathic medicines \textit{in vitro} demonstrate consistent and reproducible effects on basophil degranulation (responsible for histamine release, immune activation and allergy symptoms). Homeopathic preparations, at high dilutions, inhibit the up-regulation in anti-IgE stimulated human basophils, demonstrating a molecular model of how homeopathic medicines work at the cellular level.\textsuperscript{14}

**Reduced Need for Conventional Medicines**

Fifty-six percent of patients in an Israeli study reduced their use of conventional medications following homeopathic intervention for their allergies. Patients who used conventional medications for their allergic disorders reduced medication expenses by an average of 60\%, with an average savings of $24 per person in the 3-month trial period following the homeopathic intervention.\textsuperscript{15}

In Switzerland, a government conducted review of clinical trials of homeopathic medicines found that homeopathy was efficacious in 29 studies of upper respiratory tract infections (URTI) and allergic reactions. In 6 out of 7 controlled trials, homeopathy was equivalent to (or better than) conventional treatment.\textsuperscript{16}

**Homeopathy and Pediatric Allergies**

An observational longitudinal study of more than 850 children over 16 years demonstrated major overall improvement in more than 75\% of participants. Complete remission was noted in 70\% of those with atopy, 84\% with dermatitis, 48\% with allergic rhinitis, and 71\% with asthma. Forty percent of children with two or three atopic diseases at the first visit had complete remission.\textsuperscript{17}

A prospective multicenter observational study of 40 children with allergic conjunctivitis, allergic rhinitis, bronchial asthma and neurodermatitis demonstrated substantial improvement ($p < 0.001$) after homeopathic treatment. Most patients (68\%) utilizing conventional medicines at the outset of the study were able to discontinue at least one conventional drug, while the remainder (32\%) were able to significantly reduce dosages after using homeopathy. No side effects were reported during treatment.\textsuperscript{18}

\textsuperscript{15} Mathie RT. "Effects of Homeopathic Intervention on Medication Consumption in Atopic and Allergic Disorders." Homeopathy 2002; 91(4): 61.
A multi-centric open clinical trial of more than 630 children suffering from acute rhinitis were treated with individually selected homeopathic medicines. All subjects noted a significant change in their symptom score from the baseline (p<0.05) over one week of treatment. No complications were observed during the treatment, and adverse events included hyperpyrexia in 2 children only. The authors concluded that homeopathic medicines are both safe and useful in the management of acute rhinitis of children.\textsuperscript{19}

**Conclusion**

The U.S. population is demanding less harmful and more effective treatment interventions for non-emergency chronic health conditions, particularly for children and those suffering from allergies. Clinical trials of homeopathic treatment demonstrate impressive “real world” efficacy in many types of allergies, without the common side effects or other long-term negative health outcomes associated with conventional medicines. Laboratory evaluations confirm that homeopathic medicines differ from placebo, while research demonstrates that biologically active material is present in high dilutions of these medicines. Further research, funding of education and infrastructure and utilization of homeopathy at all levels of public health should be encouraged for this two-century-old form of safe, natural, and effective medicine for allergy reduction.

**About the Author**

*Kathleen Scheible, Certified Classical Homeopath (CCH), has a homeopathy general practice in San Francisco, California. Kathleen got interested in homeopathy because of how much it benefited her kids, and transitioned to practicing homeopathy after an engineering career in Silicon Valley. Kathleen is the founder of the Bay Area Homeopathy Association and is the current president of the California Homeopathic Medical Society.*

Conclusion from Americans for Homeopathy Choice

When properly manufactured and applied, homeopathic medicine plays an important role in the treatment of patients with major health problems across the globe. Homeopathy is inexpensive, effective, and inherently safe. When properly utilized, homeopathy makes it possible to make what already exists currently in the conventional health care system, more effective. For example, homeopathy makes it possible to avoid overuse of antibiotics, reserving antibiotics for when they are actually needed. Homeopathy also reduces the need to rely on dangerous and addictive painkillers in various situations including postoperatively, and after injury. Among many other benefits, homeopathy also helps reduce the incidence of polypharmacy.

Positive results such as these are achieved because homeopathy is a well-developed system of individualized medicine. Those who use homeopathy consider it a “designer” medicine, customized to their specific needs.

We are concerned that the proposed Draft Guidance on homeopathy will undermine the right of individuals to choose homeopathy, and also undermine the very important role homeopathy has to play in addressing these health problems. This paper gives an example of how homeopathy can address serious problems in our current healthcare system - specifically the issues involving conditions relating to allergies. It is important that FDA actions strengthen rather than undermine homeopathy so that it can meaningfully contribute to and support the American healthcare system.
