

*Safeguarding the Freedom to Choose
Homeopathy for All Americans*

What is Homeopathy?

Imagine a future in which people with illnesses both serious and minor can obtain medicine tailored to their particular physiology—medicine which is broadly effective, inherently safe, affordable, widely available, and almost always free of side effects. Imagine a future in which that medicine can treat both the physical and psychological components of an illness simultaneously. Users of homeopathic medicines don't have to imagine such a future because that future is already here in the form of homeopathy.

Homeopathy has been around for over 200 years and is a system of medicine designed to treat the whole person, both physically and psychologically without toxic side effects. Homeopathy recognizes the connection between our physical health and our emotional lives and works to clear both of symptoms that impede us.

German physician Samuel Hahnemann (1755 – 1843), the father of homeopathy, sought ways to treat his patients without the toxic side effects and dangerous procedures prevalent in the medicine of his day. He searched for alternatives to bloodletting, leeches, and medicines made from mercury, lead, arsenic, and various strong herbs which resulted in toxic effects and sometimes death in patients.

If the watchword in medicine is “first, do no harm,” Hahnemann was a faithful seeker in this tradition. He learned of an ancient principle in medicine known as “like cures

like.” The principle was mentioned by the ancient Greek physician, Hippocrates, famous for the Hippocratic Oath, a pledge of upright professional conduct for physicians. He also found references by Paracelsus, a Renaissance physician responsible for introducing the use of chemicals and minerals in medicine.

Homeopathy is a Federally Recognized Form of Medicine

Homeopathy is a federally recognized form of medicine. The Food, Drug and Cosmetic Act classifies homeopathic medicines as drugs. By law the [Homeopathic Pharmacopoeia Convention of the United States](#) sets standards for homeopathic medicines. Until 2019, the U.S. Food and Drug Administration regulated homeopathic medicines using guidelines referred to as [Compliance Policy Guide Section 400.400](#). Thousands of [research studies, papers, and clinical trials](#) have demonstrated the effectiveness of homeopathic medicines. Their safety has long been assured by their nontoxic nature which results from very high dilution of the active ingredients.

Hahnemann noticed that various substances when ingested in undiluted form created the same symptoms as certain diseases. He conceived that by following the principle of “like cures like” these substances might be useful in treating such diseases, but only if those substances were ingested in a much more dilute form. This insight led to experiments that resulted in the first homeopathic medicines, highly dilute solutions of commonly available herbs and chemicals that elicit a healing response from the body without toxic side effects.

This now greatly expanded system is known as homeopathy and certified practitioners who practice it are called homeopaths. Homeopathy is practiced today throughout the world by medical doctors, osteopaths, naturopaths, chiropractors and other health practitioners who routinely prescribe homeopathic medicines for their patients as a low cost and inherently safe treatment for many conditions. In fact, homeopathy is used by nearly 250,000 physicians and over 500 million people worldwide—making it one of the most popular forms of integrative medicine.¹

In France alone—ranked by the World Health Organization as having the best health care system in the world—95 percent of all general practitioners and pediatricians use homeopathy in their practices.²
